What is claimed is:

1. A reciprocating compressor comprising:

a piston which reciprocates in a compression space of a cylinder by being engaged with a reciprocating motor and which has a suction path connected to the compression spaceof the cylinder;

a suction valve mounted at an end surface portion of the piston to control gas suction by opening and closing the suction path of the piston;

a discharging valve assembly mounted at a discharge side of the cylinder to control gas discharge by opening and closing the compression space; and

an adhesion preventer positioned at a contact portion between the end portion surface of the piston and the suction valve to minimize adhesion of the piston and the suction valve due to oil by reducing a contact area between the piston and the suction valve.

- 2. The compressor of claim 1, wherein the adhesion preventer is provided at an end portion surface of the piston.
- 3. The compressor of claim 2, wherein the adhesion preventer comprises a groove.
- 4. The compressor of claim 3, wherein the adhesion preventer is a groove having a depth of about $20\text{-}200\mu\text{m}$.

P23325.S03

- 5. The compressor of claim 1, wherein an oil back flow preventing protrusion is provided at the end portion of the suction path located at a front surface of the piston.
- 6. The compressor of claim 5, wherein the adhesion preventer is provided at the suction valve.
- 7. The compressor of claim 6, wherein the adhesion preventor is a groove.
